(54) Matched filter and method of phase synchronization in a receiver

(57) Herein disclosed is a matched filter for synchronizing a phase of an input wave signal with that of a desired wave signal, thereby making it possible to decrease the power consumption. The matched filter comprises a plurality of correlation units (110,120,130,140) each having a multiplier (111,121,131,141) and an integrator (113,115;123,125;133,135;141,145). The multiplier of each correlation units is designed to multiply an input signal $X(t)$ by a predetermined coefficient (a_1, a_2, a_3, a_4) at predetermined intervals in a predetermined operation cycle of the matched filter. The coefficient (a_1, a_2, a_3, a_4) sequentially varies at the intervals. The integrator (113,115;123,125;133,135;141,145) of

each correlation units is designed to integrate the product obtained by the multiplier (111,121,131,141) over the operation cycle into a correlation value. The matched filter further comprises control means (190) and a multiplexer (150). The control means (190) is designed to output a plurality of control signals at the intervals to direct the correlation units (110,120,130,140) respectively, to start operating. The multiplexer (150) electrically connected to the correlation units (110,120,130,140) for inputting the correlation values and sequentially outputting one of the correlation values in response to the control signal and resetting the one correlation value.

ANNEX TO THE EUROPEAN SEARCH REPORT ON EUROPEAN PATENT APPLICATION NO.

EP 98 30 4535

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report.
The members are as contained in the European Patent Office EDP file on
The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
